The INEMAR project

INEMAR (INventario di EMissioni in ARia - Air Emission Inventory) is a database developed in order to carry out an atmospheric emission inventory, that is say, to estimate emissions of different pollutants for different activities (heating, road transport, agriculture, industry, etc.).

Information gathered in the INEMAR system are the variables needed for the estimations of emissions: activity indicators (fuel consumption, paint consumption, incinerated quantity, etc.), emission factors, statistical data needed for temporal and spatial distribution of emissions.

In particular, the system was applied for the years 2001, 2003, 2005, 2007, 2008, 2010, 2012 and 2014 to macro-pollutants and micro-pollutants estimations.
